Disc mower

Chassis Nr.

Dear Farmer

You have just made an excellent choice. Naturally we are very happy and wish to congratulate you for having chosen Pöttinger. As your agricultural partner, we offer you quality and efficiency combined with reliable servicing.

In order to assess the spare-parts demand for our agricultural machines and to take these demands into consideration when developing new machines, we would ask you to provide us with some details.

Furthermore, we will also be able to inform you of new developments.

Important information concerning Product Liability.

According to the laws governing product liability, the manufacturer and dealer are obliged to hand the operating manual to the customer at the time of sale, and to instruct them in the recommended operating, safety, and maintenance regulations. Confirmation is necessary to prove that the machine and operating manual have been handed over accordingly.

For this purpose,

- document A is to be signed and sent to Pöttinger,
- document B remains with the dealer supplying the machine,
- and the customer receives document C.

In accordance with the laws of product liability, every farmer is an entrepreneur.

According to the laws of product liability, property damage is damage caused by a machine and not to it. An excess of Euro 500 is provided for such a liabilioty.

In accordance with the laws of product liability, entrepreneurial property damages are excluded from the liability.

Attention! Should the customer resell the machine at a later date, the operating manual must be given to the new owner who must then be instructed in the recommended regulations referred to herein.

INSTRUCTIONS FOR PRODUCT DELIVERY

Dokument D

PÖTTINGER Landtechnik GmbH Industriegelände 1 A-4710 Grieskirchen Tel. 07248 / 600 -0 Telefax 07248 / 600-2511

According to the product liability please check the above mentioned items.

Please check.	X
	Machine checked according to delivery note. All attached parts removed. All safety equipment, drive shaft and operating devices at hand.
	Operation and maintenance of machine and/or implement according to operating instructions explained to the customer.
	Tyres checked re. correct pressure.
	Wheel nuts checked re. tightness.
	Drive shaft cut to correct lenght.
	Correct power-take-off speed indicated.
	Fitting to tractor carried out: to three-point linkage
	Trial run carried out and no defects found.
	Functions explained during trial run.
	Pivoting in transporting and operating position explained.
	Information given re. optional extras.
	Absolute need to read the operating manual indicated.

In order to prove that the machine and the operating manual have been properly delivered, a confirmation is necessary. For this purpose please do the following:

- sign the document A and send it to the company Pöttinger or via the internet to www.poettinger.at
- document B stays with the specialist factory delivering the machine.
- document C stays with the customer.

CE sign

The CE sign, which is affixed by the manufacturer, indicates outwardly that this machine conforms to the engineering guideline regulations and the other relevant EU guidelines.

EU Declaration of Conformity (see supplement)

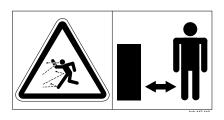

By signing the EU Declaration of Conformity, the manufacturer declares that the machine being brought into service complies with all relevant safety and health requirements.

Recommendations for work safety

All points referring to satety in this manual are indicated by this sign.

Meaning of warning signs

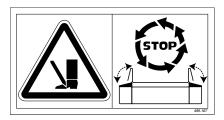

Danger - flying objects; keep safe distance from the machine as long as the engine is running.

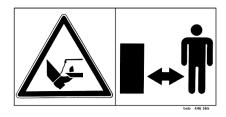

Wait until all machine components have stopped completely before touching them.

Stay clear of swinging area of implements

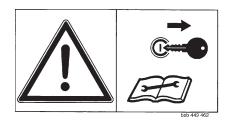

Close both side protective coverings before engaging p.t.o..

Stay clear of mower knife area as long as tractor engine is running with PTO connected.

Never reach into the crushing danger area as long as parts may move.

Shut off engine and remove key before performing maintenance or repair work.

9700_GB-Warnbilder_361 - 5 -

Attaching implement to tractor

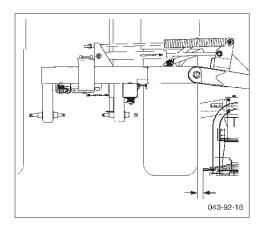

Safety hints:

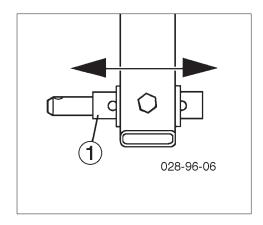

see supplement-A1 points 7.), 8a. - 8h.)

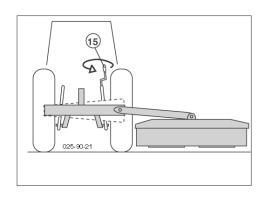

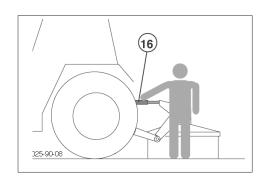

- Adjust lower link bolt (1) on frame accordingly.

- Bring frame into horizontal position by adjusting linkage arm spindle (15).

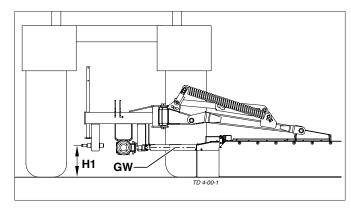

- By turning upper link spindle (16) the cutting height is adjusted .

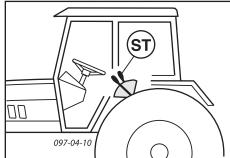

Adjusting lower links

- The drive shaft (GW) position should be approximately horizontal when mowing.
 - Set the tractor's lifting gear accordingly (H1)
 - Set the tractor hydraulics (ST) using the bit stop.

This height allows optimal evenness when working on uneven ground and need not be changed for swinging cutter bar up.

- Connect hydraulic snap coupling for swivel cylinder.

Important recommendation!

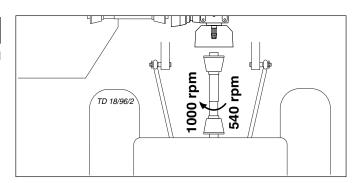

A transfer, which is located near the gear, advises which p.t.o. speed your mower unit is equipped for.

Standard: Gear for power take-off 1000 rpm.

Optional exra: Gear for power take-off 500 rpm.

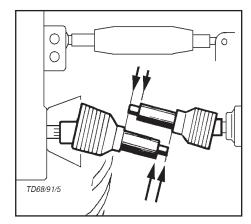

Order number: spare part book

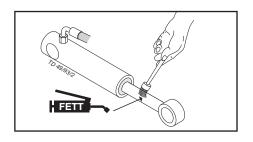

Fitting drive shaft

 Before operating for the first time, drive shaft is to be checked and adapted if necessary. See alse chapter "Drive Shaft" in supplement B.

Parking in the open

When parking for longer periods in the open, clean plunger rods and then coat with grease.

(348) ANBAU 0000-GB - 7 -

Conversion from working to transport position

NOTE:

The implement has been so designed that the mower unit is positioned as close as possible to the tractor. This has important advantages for both mowing and transporting operations.

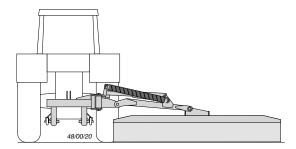

- The implements's centre of gravity lies close to the tractor and through this
 - less supporting structure load
 - less load alleviation of the steering axle when transporting
 - better cutter bar ground adaption when mowing
- The mower bar can be swivelled into 3 different positions for transportation.

Attention!

Take care with transport positions 1, 2, 3.

Before swivelling the cutter bar up, turn off the drive and wait for the mower discs to come to a complete standstill.

Safety Precaution!

see supplement-A1 points 7.), 8c. - 8h.)

Changing from working position to transport position is only to be carried out on even, firm ground.

Never let mowing mechanism run with the mower raised.

Conversion from transport to working position

Swinging cutter bar down

 Make sure that swivel area is free and that nobody is standing in the danger area.

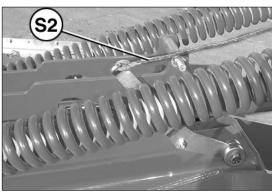

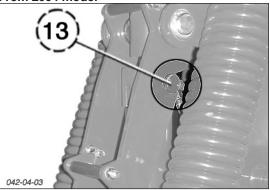

- Gently raise cutter bar with swivel cylinder so that hook (13) can be released.
- Release hook (13) by pulling on the rope (S2).
- Lower cutter bar hydraulically.

Up to 2003 model

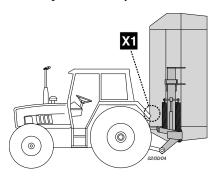

From 2004 model

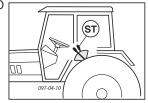

Transport position - 1

Mower bar only swivelled up at the side.

- Pull on rope (S2) and simultaneously actuate servovalve (ST).
- Gradually move cutter bar into vertical position and release rope (S2).
- Secure cutter bar with hook (13).
- Servo-valve (ST) to O position

Tips for transportation:

Do not move the servo-valve (ST) to the "float" position. The hook (13) will become very worn.

- Before driving on roads always check correct locking!
- Connect lighting and raise implement for transport.
- Before leaving the tractor lower cutter bar to ground!

Ensure a sufficient gap (X1)!

Incombination with larger tractor types, it could happen

that there is insufficient gap to the mud guard or tyre (X1) which could then cause a cxollision with the cutter bar.

If this is the case, this transport position must not be used.

It is possible to try to move the cutter bar further to the right.

 Insert lower linkage bolts accordingly (see instructions in the supplement to this manual)

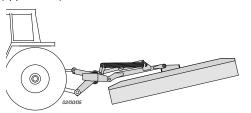

max. 3 m

However the total sidth must not exceed a maximum of 3 m.

Transport position - 2

Mower bar swivelled back.

Cutter bar o the rear and swivelled up until it stops (approx. 20°)

Attention!

Important instructions in the chapter entitled "Parking the implement"

Note: Only short trips at low speed may be carried out in this position

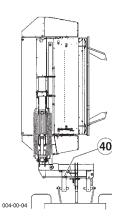

Variant 1:

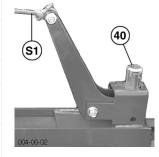

Without hydraulic slewing mechanism

- Lower cutter bar to ground.
- Release bolt (40) by pulling on the rope (S1) and move forwards with the tractor.

In doing so, the cutter bar swivels back so far until the bolt (40) is locked into position.

 Raise the implement using the tractor's lifting gear.

Variant 2:

With hydraulic slewing mechanism

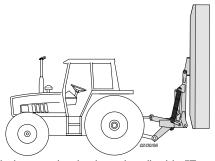

An additional double-action hydraulic connection is necessary on the tractor.

A hydraulic unit is installed instead of a mechanical slewing unit (with bolts 40). See chapter "Collision Safety".

- Raise cutter baractuate single-action control valve (ST)
- Swivel cutter bar to the rearactuate double-action control valve (ST)

Transport position - 3

Cutter bar to the rear and swivelled up (approx. 90°).

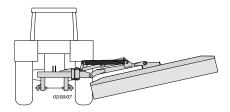

- Swivel mower bar back as described in "Transport Position - 2".
- Move mower bar into vertical position as described in "Transport Position - 1".
- Secure cutter bar with hook (13).
- 3. Before driving on roads always check correct locking!
- Connect lighting and raise implement for transport.
- Before leaving the tractor lower cutter bar to ground!

Transport position - 4

Cutter bar laterally swivelled up (approx. 20°)

- this position upwards is limited by a stop buffer.

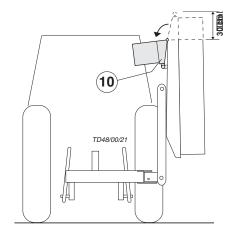

- only for turning manoeuvres in the field.
- do not use on roads or public thoroughfares!

Reducing the Total Height

Before converting to transport position

 The external guard plate (10) can be swivelled in to reduce the total height (- 30 cm) when in the transport position.

Note:

For safety reasons the mower disks must be at a complete standstill before swivelling the guard plate.

Dismount implement from tractor

Important!

Keep to the order of operation

- 1. Shift servo to floating position so that no residual air pressure remains in hydraulic lines.
- 2. Let bolt (13a) rest in the hook.
 - Pull the rope (S2)
 - Lower mounting frame with lifting gear until the bolt (13a) rests in the hook.
- Move the lever (13b) to the locking position Doing this secures the bolt (13a) in the hook

This safeguard is important!

Otherwise the danger exists that the mounting frame of the cutter bar could swivel up in jerks and jolts when uncoupling the lower link

- 4. Bring support stand (14) into support position and secure with linch pin
- 5. Lower lifting gear far enough so that implement stands on support stand on the ground
- 6. Dismount implement from tractor (15)
 - Uncouple drive shaft.
 - Uncouple hydraulic lines.
 - Remove rope from tractor cabin.

Instructions

The lever **13b** is a safety device. It should not be changed in its form and functions.

The lever is so constructed that it will not spring out from the bolt position (13b, 13a) during hydraulically slewing of the mowing bar. The lever is thus only damaged (deformed) but remains in the bolt position.

This has been arranged by the manufacturer – for safety reasons.

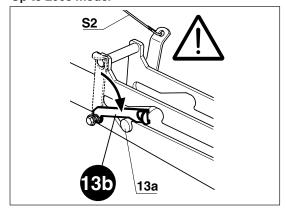

- Do not operate the hydraulic cylinder to slew across the mowing bar when the lever is in the bolt position
- Exchange damaged levers immediately for new ones.

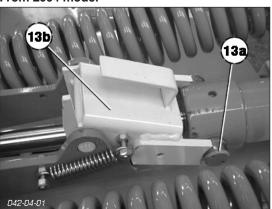

Attention!

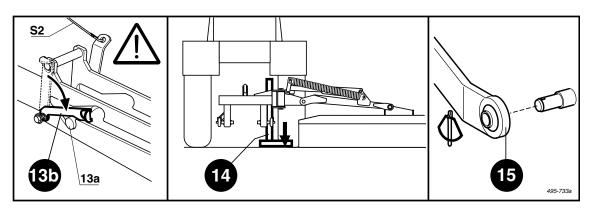

- Always park implement steadfast
- Use support stand otherwise danger of tipping
- Danger of injury from crushing and shearing sections in the area of the support stand
- Follow the instructions on the following page also.

Up to 2003 model

From 2004 model

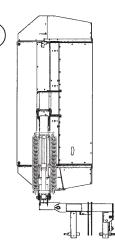

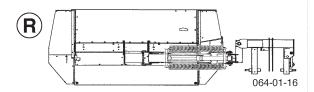

0400_GB-Abbauen_348 - 11 -

Parking the implement

The implement can be parked in two positions (R and H).

 Do not set the hydraulic control valve to floating position if the support stand is raised.

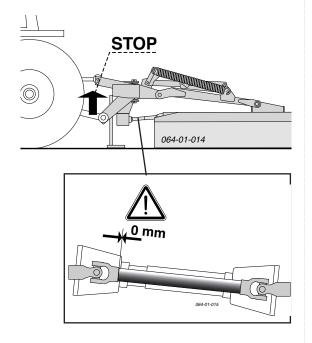

Attention! (STOP)

The support stand should not be raised too high

- if the implement is parked in "H" position and the hydraulic control valve is set to floating position.

The drive shaft could thus be damaged as it is telescoped on to the bar (0mm).

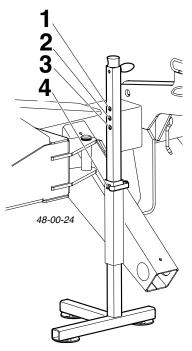

Support Stand

The support stand can be pinned in 4 positions

Positions 1, 2, 3: when parking the implement

Position 4: For transport and operating positions

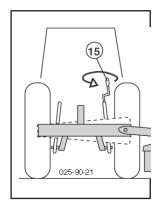

Beware!

Before uncoupling the lower link, always secure the bolt 13a with the lever 13b.

Any position (1, 2, 3) can be chosen which enables lifting gear to be uncoupled without problems.

Nevertheless, should a problem arise when uncoupling the lifting gear

- park the implement on flat, firm ground
- turn the lower link adjusting spindle (15) far enough so that the lower link can be pulled from the bolt.

Caution!

Crushing and shearing sections in the lifting gear area.

0400_GB-Abbauen_348 - 12 -

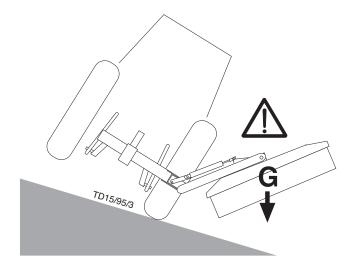

Take care when turning on slopes!

The tractor's travelling characteristics are influenced by the weight (G) of the mower unit. This can lead to dangerous situations, especially on slopes.

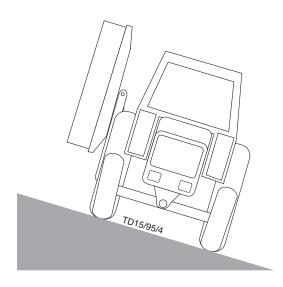

Danger of tipping occurs

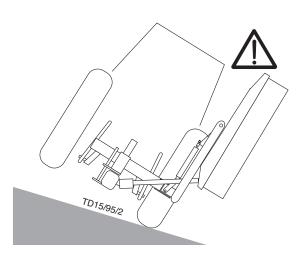

- when the mower unit is facing downhill and in a raised position,
- when travelling in a left-hand curve with the mower unit raised,
- when travelling in a left-hand curve in the transport position (mower unit completely raised).

Safety advice

- Reduce speed in left-hand curves accordingly.
- Travel so that the raised mower unit is facing uphill.
- It is better to travel in reverse on a slope than to carry out a risky turning manoeuvre.

(358) 9500-GB HANGFAHRT - 13 -

Important points before starting work

Safety hints:

see supplement-A1 points 1. - 7.)

After the first hours of operation

· Retighten all knife screw fittings.

Safety hints

1. Check

- Check the condition of knives and the knife holder.
- Check cutting drums for damage (see also chapter "Maintenance").
- Switch-on the machine only in working position and do not exceed the prescribed power take-off speed (for example max. 540 rpm).

540 Upm

1000 Upm

A transfer, which is located near the gear, advises which p.t.o. speed your mower unit is equipped for.

 Turn the p.t.o. on only when all safety devices (coverings, protective aprons, casings, etc.) are in proper condition and attached to the implement in the correct protective positions.

3. Pay attention to correct p.t.o. direction of rotation!

4. Damage protection!

 The surface to be mowed must be free of obstructions or foreign objects. Such objects (e.g. large stones, pieces of wood, boundary stones, etc.) can damage the mower unit.

In the event of a collision

- Stop immediately and switch off the drive.
- Carefully check the implement for damage. The mowing discs and their drive shaft must be checked in particulare.
- Have the implement checked also by a specialist workshop if necessary.

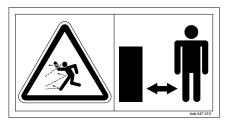

After any contact with foreign objects

- Check the condition of knives and the knife holder (see chapter "Maintenance and service").
- · Retighten all knife screw fittings.

4. Stay clear while engine is running.

- Keep people out of the danger zone - foreign bodies which can be ejected by the mower could injure them.

Special care is necessary on or near stony ground.

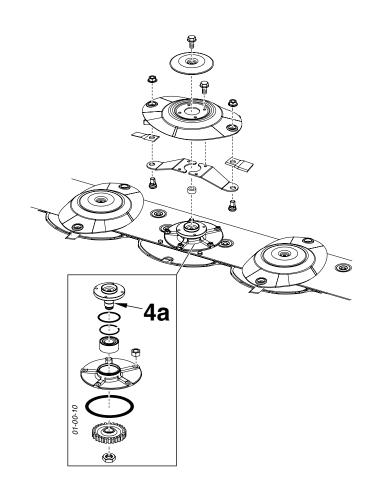

5. Wear hearing protection

The noise level in the workplace can deviate from the measured value (see Technical Data) partly because of the differing cabin types of various tractors.

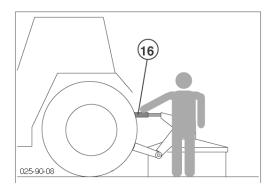

- If a noise level of 85 dB (A) is reached or exceeded, the farmer must have suitable hearing protection in readiness (UVV 1.1 §2).
- If a noise level of 90 dB (A) is reached or exceeded, the hearing protection must be worn (UVV 1.1 § 16).

Operation

1. Adjust cutting height by turning upper link spindle (inclination of the cutting discs max. 5°).

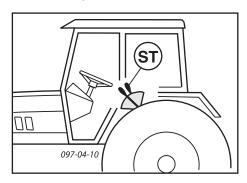

2. To mow, gradually supply power to the p.t.o. before entering the crop and bring the mowing discs up to full revs.

Smoothly increase the p.t.o. speed, in order to avoid noises in the free-wheel conditioned by the system.

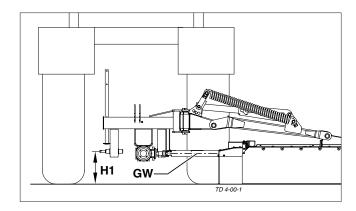

- Adjust travel speed to terrain and crop.

Adjustment

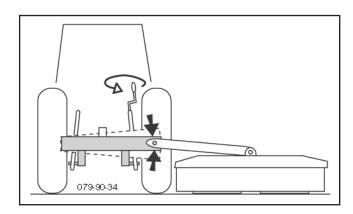

- Adjust tractor hydraulics in a way that the machine can adapt to uneven ground.
 - Put hydraulic control device (ST) into "free gear" (floating position or "lower")

- The drive shaft (GW) position should be approximately horizontal when mowing.

- Frame horizontal.

- Fix hydraulic lower links in a way that the machine cannot swing out sideways.

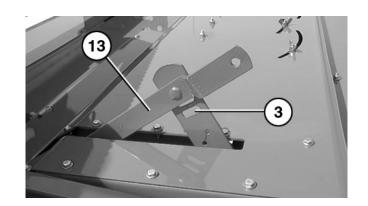

(379) 0100-GB INBETRIEBN - 15 -

Mowing with the conditioner

The conditioning effect can be modified:

- with lever (13), which adjusts the gap between adjustable plate and rotor. The conditioning effect is most intense with the lever at the bottom of its travel (Pos. 3).

However the crop should not be chopped.

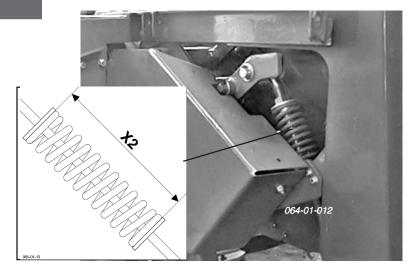

Correct belt tension

Check X2 size

NOVACAT 225: X2 = 164 mm **NOVACAT 265:** X2 = 164 mm **NOVACAT 305:** X2 = 164 mm

EUROCAT 275: X2 = 178 mm

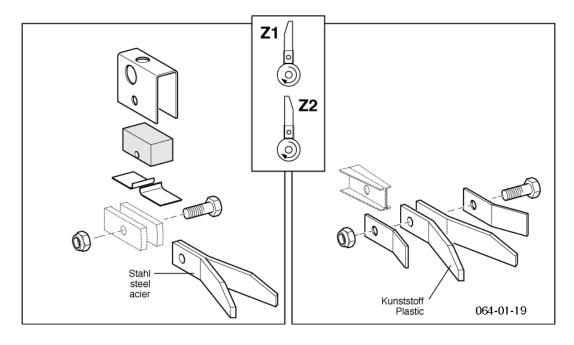

Position of the rotor prongs

Pos. Z1: position of the rotor prongs for normal operating conditions

Pos. Z2: for difficult operating conditions if for example the chuck wraps around the rotor

The rotor prongs turn 180° (pos.Z2). This prong position removes the problem in most cases. The preparation effect is thereby somewhat reduced.

Dismounting and mounting the conditioner

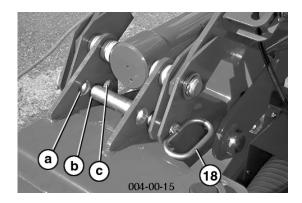

Reduce spring tension before dismounting the conditioner

Pin bolt (18) in the relative position (a, b, c)

- see chapter "MAINTENANCE"

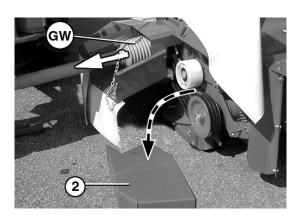

Otherwise the danger exists that the mounting frame of the cutter bar could swivel up in jerks and jolts when uncoupling the lower link

1. Loosen locking mechanism (1) and swing protection (2) up.

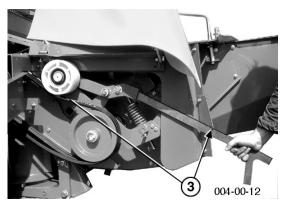

2. Remove the belt protection (2) and withdraw the drive shaft (GW) from the gear.

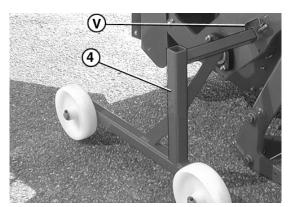

3. Remove belts

- Release the tension using lever (3) beforehand

4. Fit transport wheels (4)

- left and right
- secure with linch pin

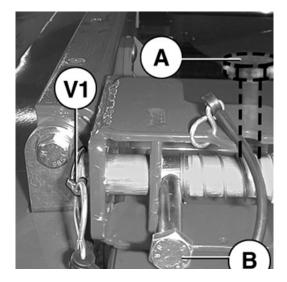

5. Release left and right locks

Spring loaded positioning bolt up to 2004 model

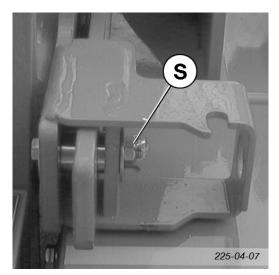

Remove linch pin (V1) and release bolts

- Pos. A = released
- Pos. B = Locked

 Screwed in from 2004 model Remove screw (S)

(Spring loaded positioning bolt = optional)

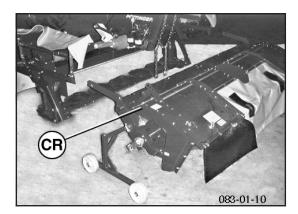

Important!

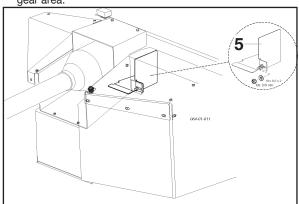

When mowing without conditioner, protective elements and the both swath formers (SB) must be mounted additionally on the cutter bar. Parts see spare parts list.

6. Always park conditioner steadfast.

7. Mount the guard (5)

This guard (5) prevents the penetration of dirt into the gear area.

Mounting the conditioner

- is effected in the reverse sequence to dismounting.

Mowing without Conditioner

Take particular notice when the conditioner is detached rom the cutter bar

Safety hint

A machine with a conditioner (CR) as a complete unit is fitted with proper protection elements.

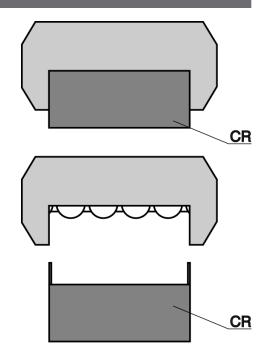

Should the conditioner be detached however, the mowing unit no longer has complete protection covering. In this situation mowing may not take place without additional protection elements!

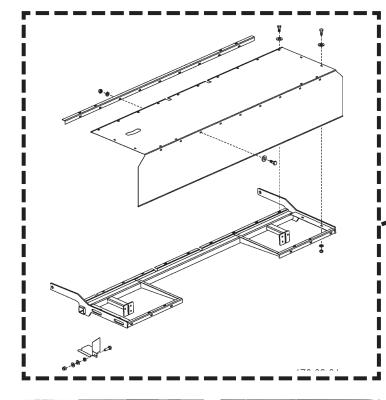

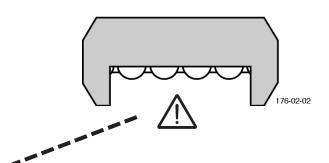

Beware!

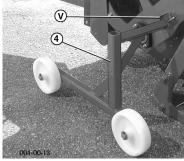

Protection elements, especially intended for this mode of mowing, must be fitted to the mowing unit.

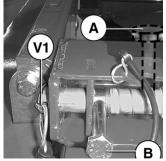

These protection elements are not included in the delivery of a new machine with a conditioner, the parts must be additionally ordered (see Spare Parts List, component group "REAR PROTECTION").

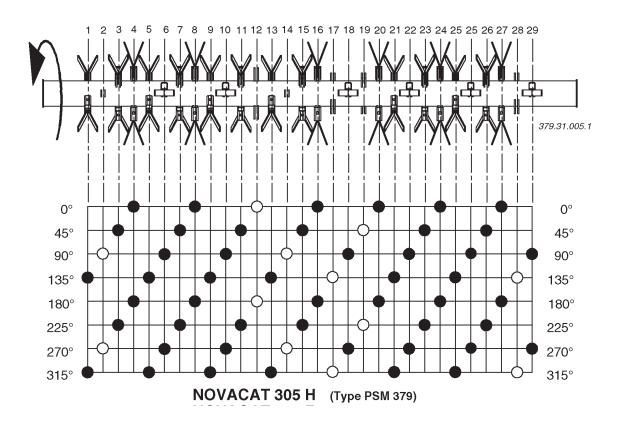

Optional extra

- Chassis (4)
- Spring-loaded fixing bolts (A-B)

For mowing without conditioner (CR)

Observe safety hint (above) without reservation!

Operation

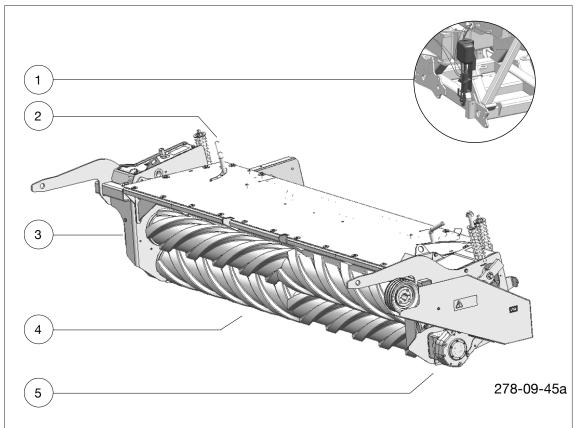

The roller conditioner is suitable for lucerne and clover types. Two driven intermeshing rollers crush the fodder. This damages the plant's natural wax coating and the drying time is accelerated.

Safety tip:

Before initial operation read and observe the operator's manual, especially the safety tips.

Designations:

- (1) Central lubricating unit (on lighting carrier)
- (2) Adjusting unit for swath board (left and right)
- (3) Maintenance unit: chain drive

- (4) Upper and lower rubber roller
- (5) Maintenance unit: belt drive

Adjustment possibilities

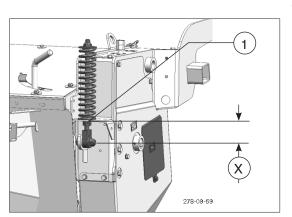

When delivered the roller conditioner is preset for medium intensity. For optimum adaptation to the surrounding conditions the following adjustments can be made:

Distance of rollers from each other:

The roller gap is set identically on the left and right side with the adjusting screw (1). base setting: (X) = 70 mm.

By reason of component tolerances an uneven roller gap can occur despite the base setting. Check and if needed reset the adjusting screw (1) on one side.

Warning!

Rotating components, danger of catching. Never open or remove protection devices when the motor is running.

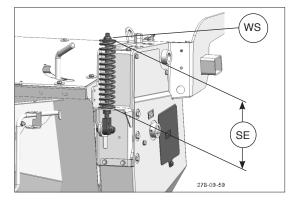

Upper roller spring tension:

The upper roller is moveable and is tensioned left and right with a spring.

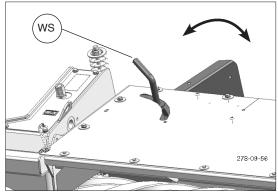

The spring tension intensity can be adjusted at any time with nut (WS).

Standard setting (SE): 210 mm

Set swath width:

The swath boards shape the cut and conditioned fodder to the desired swath width. Adjusting the swath board is carried out identically left and right by opening and adjusting the adjusting screw (ES).

Operation

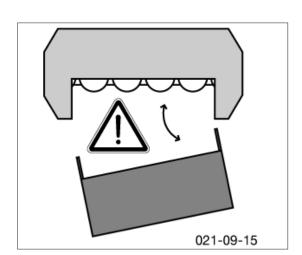

Travelling speed:

Adapt the speed to fodder consistency. Travelling to fast reduces conditioning quality and evenness.

Working without roller conditioner:

If required the roller conditioner can also be removed and replaced with a tine conditioner or swath former. (Contact sales department for more information.)

As a unit a machine with roller conditioner is fitted correctly with the proper protective devices. Should the conditioner be removed then the mower unit is no longer completely cased. In this case mowing must not take place without fitting additional protective devices!

Beware!

Danger of injury through flying parts. Keep people at a sufficiently safe distance during mowing.

Take note!

If the roller conditioner is removed, the disc mower cutting blades can be accessed freely. Great danger of injury now exists. For mowing without a conditioner, protective devices especially designed for this type of operation must be fitted to the mower bar. For a new machine with conditioner these protective devices are not included in the delivery; these parts must be ordered additionally (see spare parts list, component group "REAR PROTECTION")

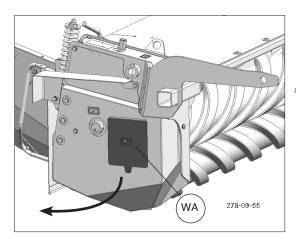

Maintenance

Cleaning: (every 20 operating hours)

- Die Abdeckungen und Wartungsöffnungen (WA) beim Riemen- und Kettenantrieb abschrauben
- · Remove deposited dirt
- · Clean rubber rollers

Dirt can impair lubrication that will subsequently cause equipment damage!

Take care!

Turn motor off and remove key before any maintenance and repair work

Chain drive maintenance unit

Lubrication: (every 20 operating hours)

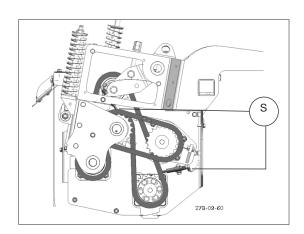

The driving chains are lubricated through the central lubricating device.

A lubricating impulse is released every time the mower is raised

- Lubricating device function check
- Check oil level. (Oil container is located on the lighting carrier)

Check the central lubricating device oil level before each operation. Operating with insufficient lubrication leads to drive chain damage.

Chain tension: (every 60 operating hours)

Short drive chain

Check chain tension with your thumb on the checking point (PP1). Optimal tolerance: 3.5 –5 mm.

Alter chain tension:

- Loosen (3) screws
- Adjust straining screw (WS1)

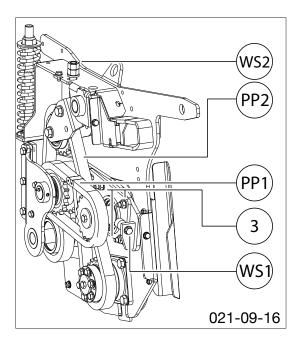

Long drive chain

Check chain tension with your thumb on the checking point (PP2). Optimal tolerance: $5-8\,\text{mm}$.

Alter chain tension:

• Adjust straining screw (WS2)

GB

Altering the roller position: (when required)

After the drive chains have been tensioned several times the roller position changes.

Alter roller position:

Loosen the screws (WS) and rotate the roller. Set the position of the lower roller so that the profile of both rollers is optimally interlock and not touch each other.

Optimal roller position prevents premature wear and tear of the rubber rollers.

Drive belts: (when required)

Check belt tension:

• Standard setting (SE): XX mm

Alter belt tension:

Adjust screw (WS)

Replace belts:

When the drive belts show signs of damage or wear, they must be replaced. (Attention: Always replace the complete belt set!)

- Loosen belt tension. To assist, the belt tightener can be deactivated using the cutter quick-change spanner (1)
- · Replace belts
- Reset belt tension

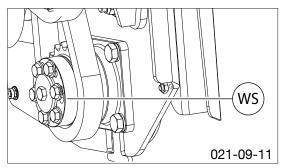

Lubrication:

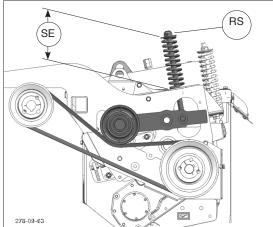

(every 20 operating hours)

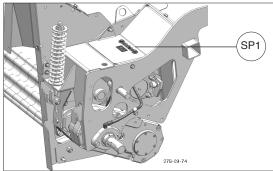

• SP 1

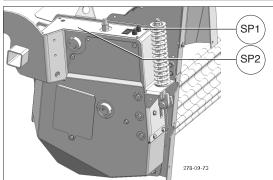

(every 100 operating hours)

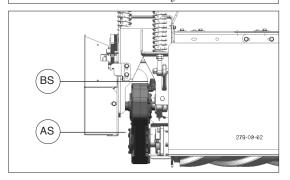

• SP 2 (Zum Schmieren die obere Abdeckung abschrauben!)

Getriebe Öl:

(Alle 100 Betriebsstunden)

Das Getriebe befindet sich auf der Aussenseite des Mähbalkens.

- Ablassschraube (AS) öffnen und Öl ablassen
- Getriebe Öl (700 ml) beim Befüllschrauben (BS) einfüllen

(Vollsynthetisches Schmieröl für Hochtemperaturschmierung, ISO-VG-Klasse 220)

SET THE POSITIONS OF THE GUIDING PLATES

Variation

"Extra dry" system

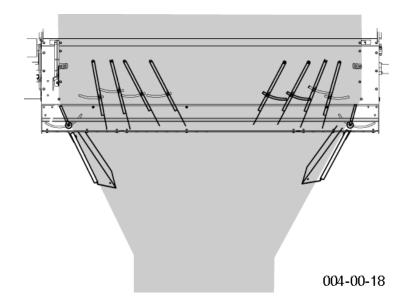

Note

The settings listed below are to be understood as basic settings. Because of the various types of crops, an optimum setting of the guiding plates can possibly first be ascertained when the machine is in use.

Swathes

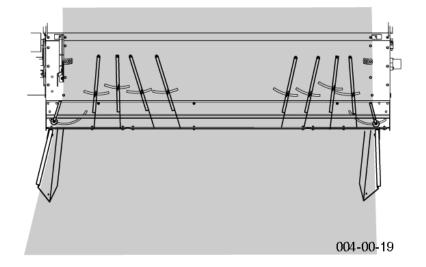

- 1. Set the positions of the guiding plates
 - see diagram

NOVACAT 305 extra dry EUROCAT 275 extra dry

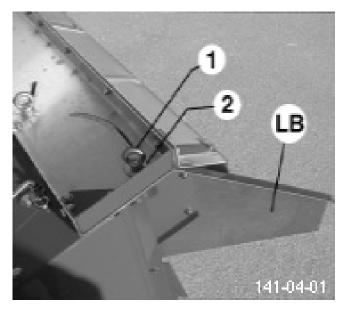

Spread width

- 1. Set the positions of the guiding plates
 - see diagram

Dismount guide plate

When spreading it could occur that the left mounted guide plate (LB) reduces the spread width.

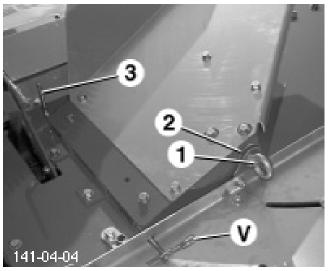

If a greater spread width is required, the guide plate can be removed.

- Remove ring bolt (1) and washer (2).
- Remove split pin (V) and pull bolt (3) out

- Mount guide plate (LB) onto the top side of the conditioner

- Bolt (3) and split pin (V)
- Ring screw (1) and washer (2)

Important: Washers in the order as shown in diagram

Mount guide plate

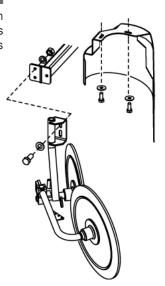

For swathing, the guide plate is to be mounted in the position provided.

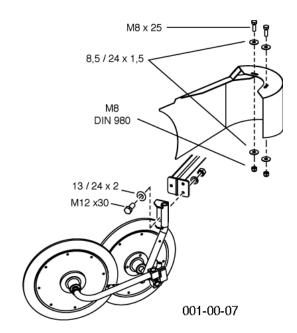

- Mounting takes place in the reverse analogical order as by dismounting.

0000-GB LEITBLECHE (379) - 26 -

Swath Discs

With the swath discs a narrower swath is formed when mowing. This prevents them from being run over by the tractor's wide tyres.

Mount guide plates

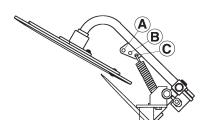

- left (1) and right (2)

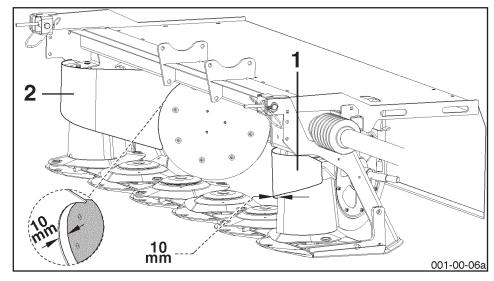

Setting both tension springs

A = for high dense forage

B = basic setting

C = for short forage

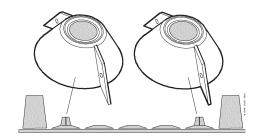

24/13 x 2 M12 A 12 25,2/34 x 1 049-97-02

Flat cone conveyor (Optional extra)

- Flat cone conveyor are recommended to improve the conveyance rate of swath deposits, particularly with heavy, thick fodder components
- For individual parts see Spare Parts List

Collision safety device

When mowing around trees, fences, boundary stones etc., collisions between the cutter bar and obstacles can occur despite careful and slow driving. Therefore, in order to prevent such damage, collision protection has been planned for the cutting device.

Attention!

It is not the intention of the collision safety device to prevent damage to the machine when working at full speed.

Variant-1: Mechanical collision safety device,

with spring loaded hook (1)

Variant-2: Hydraulic collision safety device (2),

with hydraulic slewing unit

How the hydraulic collision safety device functions

When a collision with an obstacle occurs, the cutter bar swivels back far enough for it to pass by.

Then the cutter bar can be swivelled back hydraulically into the operating position.

To do this, actuate the double-action control valve.

<u>Instruction:</u> switching from working to transport position (and vice versa) can be carried out even by this swivel device. See also chapter entitled "Transport and working position"

Function of collision safety device

If the mower encounters an obstacle, the springloaded hook (1) is released and the cutter bar can swing back.

If you reverse a short distance then, the hook is relocked into position.

Adjustment:

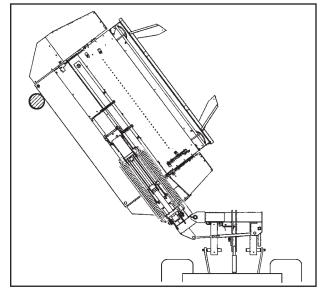

In case the safety device trips to easy adjust hexagonal nut (Attention! Adjusting measurement: min. 100 mm).

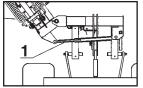

<u>Instruction:</u> adjusting measurement (X1) is the same for all types (110 mm)

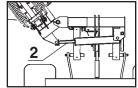

EUROCAT 275 H, 275 H-ED: X1 = 110 mm (min. 100 mm)

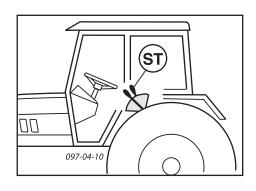

NOVACAT 225 H, 225 H-ED X1 = 110 mm (min. 100 mm) NOVACAT 265 H, 265 H-ED: X1 = 110 mm (min. 100 mm) NOVACAT 305 H, 305 H-ED X1 = 110 mm (min. 100 mm) NOVACAT 350 H: X1 = 110 mm (min. 100 mm)

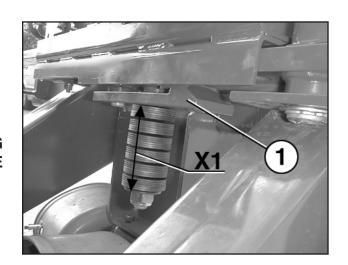

IF YOU ARE NOT SURE WHETHER THE CUTTING AREAIS REALLY FREE OF OBSTACLES, PLEASE WORK AT AN APPROPRIATE SLOW SPEED!

Safety point

 Turn engine off when adjustment, service and repair work is to be done.

General maintenance hints

In order to keep the implement in good condition after long periods of operation, please observe the following points:

 Tighten all screws after the first hours of operation.

In particular check:

- blade screws on the mowers
- tine screws on the swather and tedder.

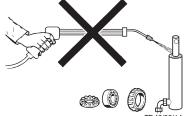

Spare part

- a. The original components and accessories have been designed especially for these machines and appliances.
- We want to make it quite clear that components and accesories that have not been supplied by us have not been tested by us.
- c. The installation and/or use of such products can, therefore, negatively change or influence the construction characteristics of the appliance. We are not liable for damages caused by the use of components and accessories that have not been supplied by us.
- d. Alterations and the use of auxiliary parts that are not permitted by the manufacturer render all liability invalid.

Cleaning of machine parts

Attention! Do not use high-pressure washers for the cleaning of bearing- and hydraulic parts.

- Danger of rust!
- After cleaning, grease the machine according to the lubrication chart and carry out a short test run.
- Cleaning with too high pressure may do damage to varnish.

Parking in the ope

When parking in the open for long periods of time, clean piston rods and then coat with grease.

Winter storage

- Thoroughly clean machine before storage.
- Put up protection against weather.
- Change or replenish gear oil.
- Protect exposed parts from rust.
- Lubricate all greasing points according to lubrication chart.

Safety points!

- Turn engine off when adjustment, service and repair work is to be done.
- Do not work under the machine without safe support.
 - Retighten all screws after the first hours of operation..

Drive shafts

- see notes in the supplement

For maintenance please note!

The instructions in this operating manual are always valid.

In case there are no special instructions available, then the notes in the accompanying drive shaft manufacturer' instructions are valid.

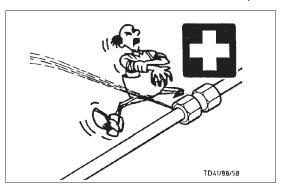

Repair Instructions

Please refer to repair instructions in supplement (if available)

Hydraulic unit

Caution! Danger of injury or infection!

Under high pressure, escaping fluids can penetrate the skin. Therefore seek immediate medical help!

After the first 10 operating hours and then every consecutive 50 operating hours

 Check the hydraulic unit and lines for tightness and retighten screw connections if necessary.

Before operation

- Check hydraulic hoses for wear.

Replace worn or damaged hydraulic hoses immediately. The replacement hoses must meet the manufacturer's technical requirements.

Hose lines are subject to natural ageing. The period of use should not exceed 5 – 6 years.

Cutter bar oil level check

 Under normal operating conditions, oil is to be replenished annually.

1. Lift one side of the mower bar (X1) and support.

X1 = Maß vom Boden bis Mähbalkenoberkante

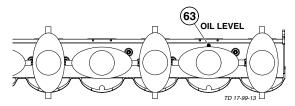

NOVACAT 305: X1 = 340 mm **NOVACAT 350:** X1 = 235 mm

- The side where the oil refill screw is located remains on the ground.
- Lift the other side of the mower bar about **X1** and support with a suitable prop.

2. Let mower bar stand in this position for some 15 minutes.

• This time is necessary to allow the oil to gather in the lower area of the mower bar.

3. Remove oil refill screw (63).

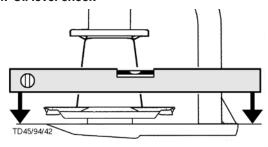

The oil level is measured at the oil refill screw hole.

Important!

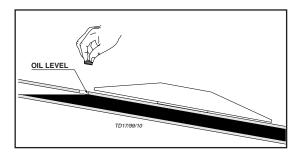

In doing so the cutter bar must be in horizontal position.

 Take out oil filler plug (63) and top up oil "SAE 90" up to the level screw¹).

4. Oil level check

The oil level is correct when the oil comes up to the level screw¹⁾ (OIL LEVEL).

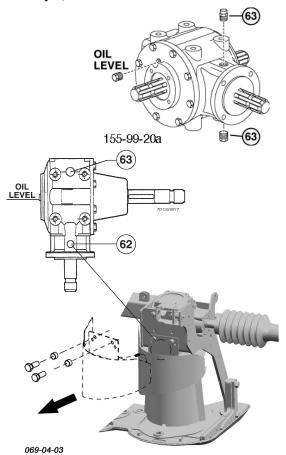

Too much oil leads to the mower bar over-heating during operation.

 Too little oil does not guarantee the necessary lubrication.

Angular gear

- Change oil after the first 50 operating hours. Under normal operating conditions, oil is to be replenished annually (OIL LEVEL).
- Change oil after 100 ha at the latest.

Quantity: 0,7 Liter SAE 90

Cutter bar

Changing oil

Change oil after the first 50 operating hours or after 100 ha at the latest.

Note:

Change oil when at operating temperature.

The oil is too viscid when cold. Too much old oil remains stuck to the gearwheels and because of this any

suspended matter present cannot be removed from the gearing.

Quantity:

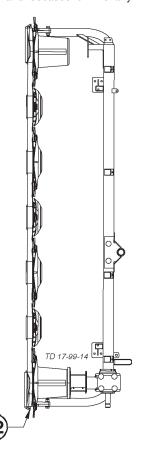

NOVACAT 305:

3,5 Liter SAE 90

NOVACAT 350:

4 Liter SAE 90

- Put cutter bar in vertical position and wait approx. 5 minutes.
- Take out oil drain plug (62), let run out and duly dispose waste oil.

Installing cutter blades

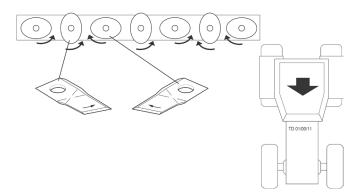

Take note!

The arrow on the cutter bla shows the cutter disc's directi of turn.

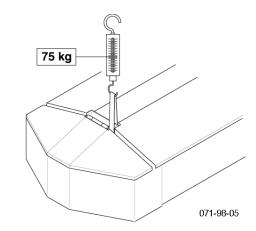

- To install, clean back plates fro varnish.

- 31 -1100-GB WARTUNG_379

Check initial spring tension.

- 1. Mount the implement onto the tractor
- see chapter "Mounting onto Tractor"
- 2. Lower cutter bar to the ground
- the ground bearing load of the cutter bar outside right should be about **75 kg.**

Alter spring tension

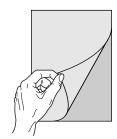

- 1. Swivel cutter bar up into the vertical position
- 2. Make sure the safety hook has engaged!
 - see also chapter "Transport position 2"
- 3. Pin bolt (18) in the relative position (a, b, c), see also Table.

Normal position of the pin bolt (18) is if the half-bolt is in the bore (17a).

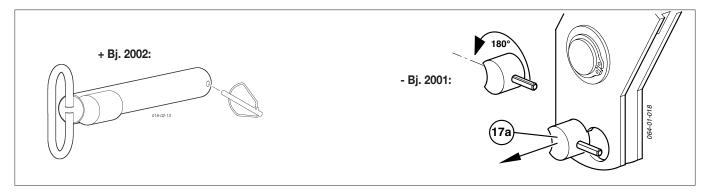

The pin bolt (18) can additionally be set up in intermediate positions. These intermediate positions can then be selected if by setting out in positions a, b, c no satisfactory bearing pressure can be achieved for the mowing bar.

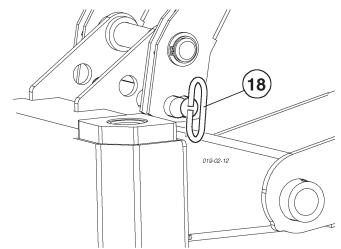

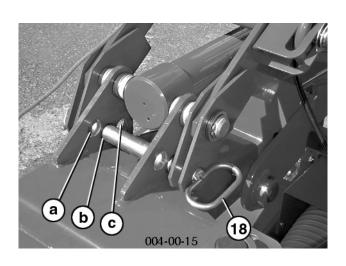

- Bj. 2001: At the same time turn the half-bolt 180° and take it out of the bore (17a). Afterwards put in the half-bolt (17) and turn as far as possible so that the pin bolt can be again inserted.
- + Bj. 2002: Pin bolt (18) in the relative position (a, b, c), see also Table.

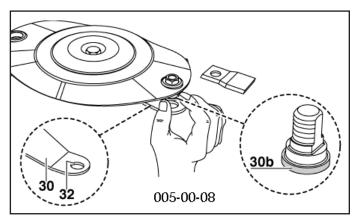

Tabel:				
NOVACAT 225	Pos. a

- 32 -0200-GB ENTLASTUNG_379

Checking wear on mowing blade holders

Wearing parts are:

- mounting of mowing blades (30)
- bolts of mowing blades (31)

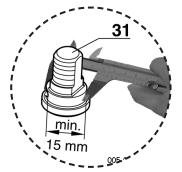

Attention!

Danger of accident if wearing parts are worn

If such wearing parts are worn out they must not be used any longer.

Otherwise accidents may be caused through parts that are flinged away (e.g. mowing blades, fragments...)

Process of visual control:

- 1. remove mowing blades
- 2. remove grass and dirt
 - around pin (31)

Attention!

Danger of accident if:

- the central part of pin of blade must have a minimum of 15 mm
- the wearing area (30a) has reached the edge of the boring
- the pin of the blade is worn in the lower part (30b)
- the pin of the blade is no longer firmly seated

If you notice one or several of these characteristics of wear stop mowing at once!

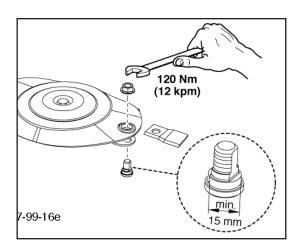

Worn parts must be replaced by original parts made by Pöttinger immediately!

Screw down the pin of the blade with the nut with 120 Nm.

Check the suspension of mowing blades as to wear and other damage:

- every time before bringing the machine into operational use
- several times during use
- immediately after hitting an obstacle (e.g. a stone, piece of wood, metal,...)

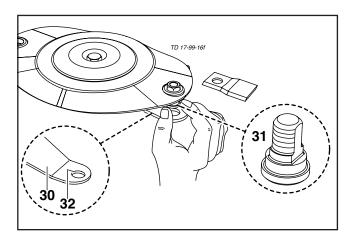

Holder for a quick change of cutter blades

Attention!

For Your Safety

- Regularly check that cutter blades are tightened firmly!
 - Cutter blades on a cutter disc should wear out simultaneously (danger of imbalance).
 - Otherwise they are to be replaced with new ones (replace in pairs).
 - Buckled or damaged cutter blades must not be used further.
- Buckled, damaged and/or worn cutter blade holders (30) should not be used further.

Checking the mowing blade suspension

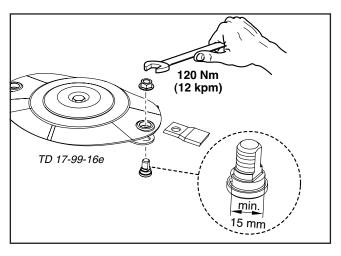

- Normal check every 50 hours.
- Check more often when mowing on stony terrain or in other difficult operating conditions.
- Check immediately after driving over a hard obstacle (e.g. stones pieces of wood, ect).

Carry out a check

- as described in chapter "Changing the Cutter Blades"

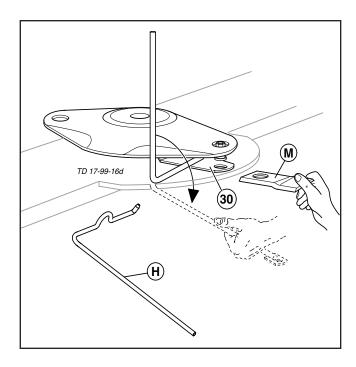

Take note!

Changing the Cutter Blades (up to 2003 model)

- 1. Insert lever (H) horizontally between cutter disc and holder (30)
- 2. Push movable holder (30) down using lever (H).

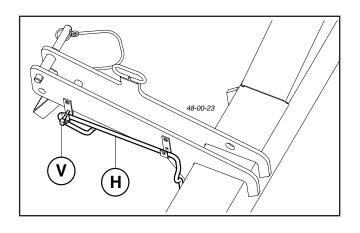

- 3. Remove cutter blade (M)
- 4. Clean forage remains and dirt away.
 - around the bolts (31) and inside the borehole (32)

5. Check:

- blade bolts (31) for damage, wear and fitting
- holder (30) for damage, change in position and fitting
- borehole (32) for damage.
 - Side surfaces must not show signs of deformation

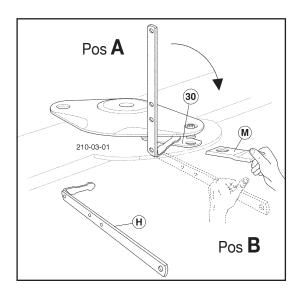

6. Fit cutter blades and remove lever (H)

 Place lever (H) into the 2 U – bolts and secure with spring cutter (V)

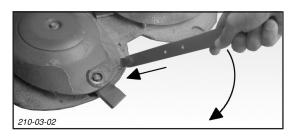

Changing the Cutter Blades (from 2004 model)

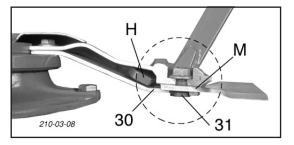

- Insert lever from left or right side on the cutter disc "Pos A" until it stops.
- 2. Swing lever from "pos. A" to "pos. B" and push the movable holder (30) down.
- 3. Remove cutter blade (M)

- 4. Clean forage remains and dirt away.
 - around the bolts (31) and inside the borehole (32)
- 5. Check:

- blade bolts (31) for damage, wear and fitting
- holder (30) for damage, change in position and fitting
- · borehole (32) for damage.
 - Side surfaces must not show signs of deformation
- 6. Install cutter blades
- 7. Visual check! Check that blade (M) is correctly

positioned between blade bolts (31) and holder (30) (see diagram).

8. Swivel lever (H) to "A" again and remove.

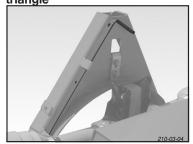

Storing the lever

- Place lever in the respective holding pouch and secure.
- See diagrams for storage places.

Hydraulic slewing unit

Necessary connections

• 1 double-action hydraulic connection (necessary minimum tractor fitting)

pressure min.: 80 bar pressure max.: 180 bar

1 single-action hyfraulic connection

(only for machines with hydraulic slewing equipment)

pressure min.: 140 bar pressure max.: 180 bar

• 7-pole electric connection for lighting (12 Volt)

Position of Vehicle Identification Plate

The chassis number is engraved on the name plate illustrated on the left. Warranty claims, enquiries and spare parts orders cannot be made without quoting the chassis number.

Please enter the number on the title page of the Operating Instructions immediately on taking delivery of the vehicle/equipment.

The defined use of the mower unit

The "NOVACAT 305 (Type PSM 379)" "NOVACAT 350 (Type PSM 380)" mower is intended solely for normal use in agricultural work.

- · The mowing of grassland and short stemmed fodder.
 - Any other uses outside of these are regarded as undefined.
 - The manufacturer takes no responsibility for any resulting damage which occurs henceforth. The risk is carried by the user alone.
- The keeping of operating, service and maintenance requirements layed down by the manufacturer also come under the heading of "defined use".

1100_GB-TECHN. DATEN _379

SUPPLEMENT

Things will run better with genuine Pöttinger parts

- · Quality and precise fitting
 - Operating safety.
- Reliable operation
- Longer lasting
 - Economy
- Guaranteed availability through your Pöttinger Sales Service.

The decision must be made, "original" or "imitation"? The decision is often governed by price and a "cheap buy" can sometimes be very expensive.

Be sure you purchase the "Original" with the cloverleaf symbol!

Recommendations for work safety

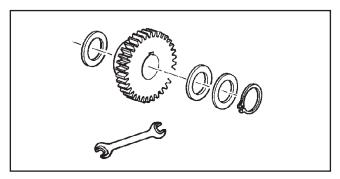

All points refering to safety in this manual are indicated by this sign.

1.) Defined use

- a. See "Technical Data".
- The keeping of operating, service and maintenance requirements layed down by the manufacturer also come under the heading of "defined use".

2.) Spare parts

- The original components and accessories have been designed especially for these machines and appliances.
- b. We want to make it quite clear that components and accesories that have not been supplied by us have not been tested by us.
- c. The installation and/or use of such products can, therefore,

negatively change or influence the construction characteristics of the appliance. We are not liable for damages caused by the use of components and accessories that have not been supplied by us.

 Alterations and the use of auxiliary parts that are not permitted by the manufacturer render all liability invalid.

3.) Protection devices

All protection devices must remain on the machine and be maintained in proper condition. Punctual replacement of worn and damaged covers is essential.

4.) Before starting work

- a. Before commencing work, the operator must be aware of all operating devices and functions. The learning of these is too late after having already commenced operation!
- The vehicle is to be tested for traffic and operating safety before each operation.

5.) Asbestos

 Certain sub-supplied components of the vehicle may contain asbestos due to technical reasons. Observe the warning on spare parts.

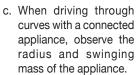

6.) Transport of persons prohibited

- a. The transport of persons on the machine is not permitted.
- b. The machine may only be driven on public roads when in the position stipulated for road transport.

7.) Driving ability with auxiliary equipment

a. The towing vehicle is to be sufficiently equiped with weights at the front or at the rear in order to guarantee the steering and braking capacity (a minimum of 20% of the vehicle's tare weight on the front axle).

 The driving ability is influenced by ground conditions and by the auxiliary equipment. The driving must be adapted to the corresponding terrain and ground conditions.

20%

8.) General

- a. Before attaching implement to three-point linkage, move system lever into a position whereby unintentional raising or lowering is ruled out!
- b. Danger of injury exists when coupling implement to tractor!
- c. Danger of injury through crushing and cutting exists in the three-point linkage area!
- d. Do not stand between tractor and implement when using threepoint linkage external operation!
- e. Attach and detach drive shaft only when motor has stopped.
- f. When transporting with raised implement, secure operating lever against lowering!
- g. Before leaving tractor, lower attached implement to the ground and remove ignition key!
- Nobody is to stand between tractor and implement without tractor being secured against rolling using parking brake and/or wheel chocks!
- For all maintenance, service and modification work, turn driving motor off and remove universal drive.

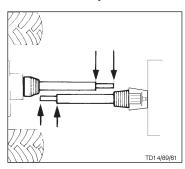

9.) Cleaning the machine

Do not use high-pressure washers for the cleaning of bearing- and hydraulic parts.

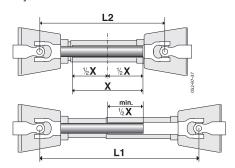

Matching driveshaft to tractor

To determine the actual length required, hold the two halves of the driveshaft side by side.

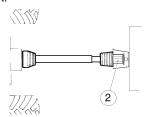

Procedure for cutting to length

 To determine length required, set implement in closest working position (L2) to tractor, hold driveshaft halves side by side and mark off.

Important!

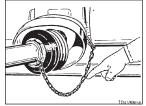

- Note the maximum operating length (L1)
 - Try to attain the greatest possible shaft overlap (min. ¹/₂ X)!
- Shorten inside and outside tube guard by the same amount.
- Fit torque limiter (2) of drive shaft to implement end of driveshaft!

 Always check that drive shaft locks are securely engaged before starting work.

Retaining chain

Use chain to prevent tube guard from rotating.
 Take care that chain does not impede driveshaft pivoting.

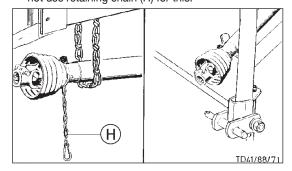

Rules for working

Never exceed the maximum p. t. o. speed when using the implement.

 When the p.t.o. is switched off, the implement hitched up may not stop at once.

Do not go close to the implement until all motion has stopped; only then may work be done on it.

- When the implement ist parked, either remove the driveshaft and store it, or secure it with a chain. Do not use retaining chain (H) for this.

Important!

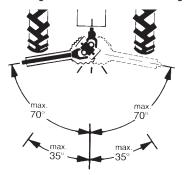

Only use the indicated or accompanying drive shaft, otherwise the right to claim under guarantee for any possible damage does not exist.

Wide-angle joint:

Maximum angle of deflection when working/stationary: 70°

Standard joint:

Maximum angle of deflection when stationary: 90° Maximum angle of deflection when working: 35°

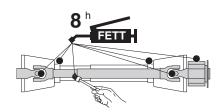

Maintenance

Replace worn-out covers/guards at once.

- Lubricate with a brand-name grease before starting work and every 8 hours worked.
- Before any extended period of non-use, clean and lubricate driveshaft.

For winter working, grease the tube guards, to avoid them freezing together.

How a cam type cut out safety clutch works

This overload clutch switches the torque transmitted to zero if overloaded. To revert to normal operation, stop the p.t.o. drive briefly.

The clutch reengages at a speed below 200 rpm.

IMPORTANT!

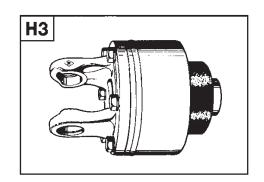

Re-engaging is also possible by decreasing the p.t.o. r.p.m.

TAKE NOTE!

The overload clutch on the driveshaft is not a "Full up" indicator. It is purely a torque limiter designed to protect the implement against damage.

Driving the right way will avoid triggering the clutch too often, and thus causing unnecessary wear on it and the implement.

Lubricating interval: 500 hrs (Special lubricant)

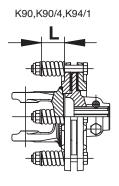

Important for driveshafts with friction clutch

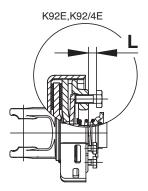

Torque is limited with overloading and brief torque peaks and evenly transferred during slipping.

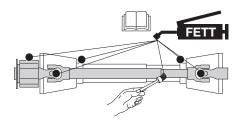

Prior to initial operation and after long periods out of use, check friction clutch for proprer function.

- a.) Measure dimension "L" at compression spring of K90, K90/4 and K94/1 or at set screw of K92Eand K92/4E.
- b.) Loosen screws to release the pressure on the friction disk.
 - Slip the clutch.
- c.) Tighten set screws to dimension "L".

Clutch is ready for use.

Lubricants

Edition 1997

The performance and the lifetime of the farm machines are highly depending on a careful maintenance and application of correct lubricants, our schedule enables an easy selection of selected products.

The applicable lubricants are symbolized (eg. "III"). According to this lubricant product code number the specification, quality and brandname of oil companies may easily be determined. The listing of the oil companies is not said to be complete.

Gear oils according to operating instructions - however at least once a year.

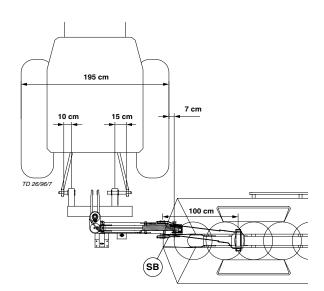

- Take out oil drain plug, let run out and duly dispose waste oil.

Before garaging (winter season) an oil change and greasing of all lubricating points has to be done. Unprotected, blanc metal parts outside (joints, etc.) have to be protected against corrosion with a group "Iv" product as indicated on the reverse of this page.

ΤΟΠΟΘΕΤΗΣΗ ΔΙΑΤΑΞΗΣ ΠΛΕΥΡΙΚΗΣ ΜΕΤΑΤΟΠΙΣΗΣ

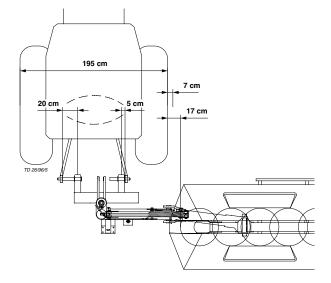

Εκδόσεις τοποθέτησης

Παράδειγμα: Τρακτέρ με πλάτος 195 cm.

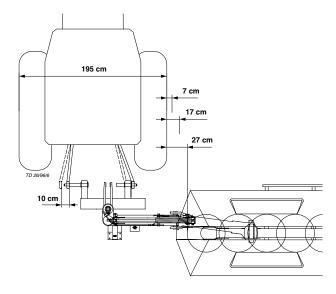

1η Έκδοση τοποθέτησης (7 cm)

- Μοντάρετε τον πίρο του κατώτερου βραχίονα σύμφωνα με το σχέδιο
 - αριστερά **10 cm**
 - δεξιά **15 cm**

2η Έκδοση τοποθέτησης (17 cm)

- Αλλάξτε τους πίρους του κατώτερου βραχίονα αριστερά και δεξιά και μοντάρετέ τους σύμφωνα με τι σχέδιο
 - αριστερά **20 cm**
 - δεξιά **5 cm**

3η Έκδοση τοποθέτησης (27 cm)

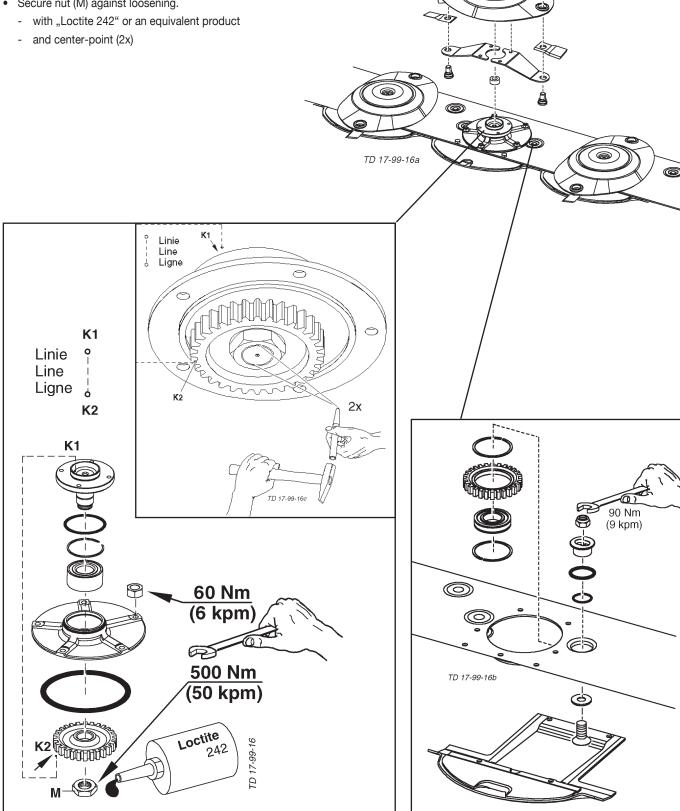

- όπως στο σημείο 2 ωστόσο πρόσθετα
 - Μετακινήστε τον κατώτερο βραχίονα κατά **10 cm**

110 Nm (11 kpm)

120 Nm (12 kpm)

Repairs on the cutter bar

- Adjust markings in a line (K1, K2).
- Only screw the nut (M) on when there is sufficient thread length in order to prevent any damage.
- Secure nut (M) against loosening.

R-49 0300-GB REP. HINWEISE_397.P65

Taper bushes installation instructions

To assemble

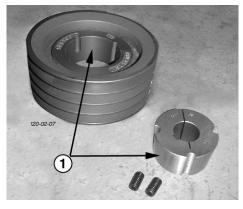

- 1. Clean and degrease the bore and taper surfaces of the bush and the tapered bore of the pulley.
- 2. Insert the bush in the pulley hub and line up the holes (half thread holes must line up with half straight holes).
- 3. Lightly oil the grub screws (bush size 1008 to 3030) or the cap screws (bush size 3535 to 5050) and screw them in, do not tighten yet.
- 4. Clean and degrease the shaft. Fit pulley with taper bush on shaft and locate in desired position.
 - When using a key it should first be fitted in the shaft Keyway.
 There should be a top clearance between the key and the keyway in the bore.
 - Using a hexagon socket wrench (DIN 911) gradually tighten the grub/cap screws in accordance with the torques as listed in the schedule of screw tightening torques

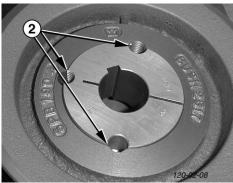

Bush identifier	Torque [Nm]
2017	30
2517	49

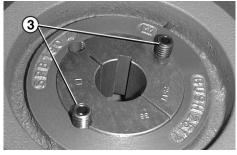

- When the drive has been operating under load for a short period (half to on hour) check and ensure that the screws remain at the appropriate tightening torque.
- In order to eliminate the ingress of dirt fill all empty holes with grease.

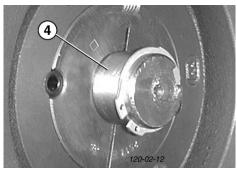

Removal

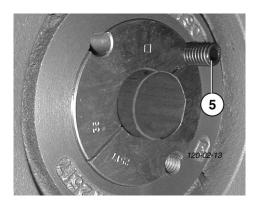

- Slacken all screws. Depending on the size of the bush remove one or two.
 - After oiling point and thread of grub screws or under head and thread of cap screws insert them into the jacking off holie(s) in bush (Pos. 5).
- 2. Tighten screw(s) unitormly and alternately until the bush is loose in the hub and pulley is free on the shaft.
- 3. Remove pulley bush assembly from shaft.

Combination of tractor and mounted implement

The mounting of implements on the front or rear three point linkage shall not result in exceeding the maximum permissible weight, the permissible axle loads and the tyre load carrying capacities of the tractor. The front axle of the tractor must always to be loaded with at least 20 % of the unladen weight of the tractor.

Make sure before buying an implement that these conditions are fulfilled by carrying out the following calculations or by weighing the tractor/implement combination.

Determination of the total weight, the axle loads, the tyre load carrying capacity and the necessary

For the calculation you need the following data:

	-			
$\mathbf{T}_{L}\left[kg\right]$	unladen weight of tractor	a [m]	distance from centre of gravity for combined front mounted implement/front	23
$\mathbf{T_{v}}\left[kg\right]$	front axle load of unladen tractor		ballast to front axle centre	
T _H [kg]	rear axle load of unladen tractor	b [m]	Tractor wheelbase	13
G _H [kg]	combined weight of rear mounted implement/rear ballast	c [m]	distance from rear axle centre to centre of lower link balls	13
G_v [kg]	combined weight of front mounted implement/front 2 ballast	d [m]	distance from centre of lower link balls to centre of gravity for combined rear mounted implement/rear ballast	2

- 1 see instruction handbook of the tractor
- 2 see price list and/or instruction handbook of the implement
- 3 to be measured

Consideration of rear mounted implement and front/rear combinations

1. CALCULATION OF MINIMUM BALLASTING AT THE FRONT $\mathbf{G}_{\mathrm{v}_{\mathrm{min}}}$

Record the calculated minimum ballasting which is needed at the front of the tractor into the table.

$$G_{V \text{ min}} = \frac{G_{H} \bullet (c+d) - T_{V} \bullet b + 0, 2 \bullet T_{L} \bullet b}{a+b}$$

Front mounted implement

2. CALCULATION OF THE MINIMUM $\boldsymbol{G}_{\boldsymbol{H}\, min}$

$$G_{H \text{ min}} = \frac{G_V \bullet a - T_H \bullet b + 0.45 \bullet T_L \bullet b}{b + c + d}$$

Record the calculated minimum ballasting which is needed at the rear of the tractor into the table.

3. CALCULATION OF THE REAL FRONT AXLE LOAD $\rm T_{v\,tat}$

(If with the front mounted implement (G_v) the required minimum front ballasting $(G_{v \min})$ cannot be reached, the weight of the front mounted implement has to be increased to the weight of the minimum ballasting at the front!)

$$T_{V_{tat}} = \frac{G_{V} \bullet (a+b) + T_{V} \bullet b - G_{H} \bullet (c+d)}{b}$$

Record the calculated real front axle load and the permissible front axle load of the tractor into the table.

4. CALCULATION OF THE REAL TOTAL WEIGHT $\mathbf{G}_{_{\mathrm{tat}}}$

(If with the rear mounted implement (G_H) the required minimum rear ballasting $(G_{H min})$ cannot be reached, the weight of the rear mounted implements has to be increased to at least the weight of the minimum ballasting at the rear!)

$$G_{tat} = G_V + T_L + G_H$$

Record the calculated real and the permissible total weight given in the instruction handbook for the tractor into the table.

5. CALCULATION OF THE REAL REAR AXLE LOAD $T_{\rm H\,tat}$

Record the calculated real and the permissible rear axle load given in the instruction handbook for the tractor into the table.

$$T_{H \ tat} = G_{tat} - T_{V \ tat}$$

6. TYRE LOAD CARRYING CAPACITY

Record double the value (two tyres) of the permissible load carrying capacity into the table (see for instance documentation provided by the tyre manufacturer).

Table	Real value according to calculation		Permissible value according to instruction handbook		Double permissible tyre load carrying capacity (two tyres)		
Minimum ballasting front/rear	/ kg						
Total weight	kg	≤	kg				
Front axle load	kg	≤	kg	≤	kg		
Rear axle load	kg	≤	kg	≤	kg		

The minimum ballasting has to be attached to the tractor either in form of a mounted implement or ballasting weight!

The calculated values must be less or equal (<) the permissible values!

EC Conformity Declaration

Original Conformity Declaration

Name and address of the manufacturer:

Alois Pöttinger Maschinenfabrik GmbH Industriegelände 1 AT - 4710 Grieskirchen

Machine (interchangeable equipment):

 mower
 NOVACAT
 305 H / ED / RC
 350 H

 Type
 379
 380

 Serial no.
 380

The manufacturer declares that the machines adhere to all relevant provisions in the following EU directive:

machinery 2006/42/EG

In addition to this, the manufacturer also declares adherence to the other following EU directives and/or relevant provisions

Source of applied, harmonised norms:

EN 745 EN ISO 12100-1 EN ISO 12100-2 EN ISO 4254-1

Source of applied miscellaneous technical norms and / or specifications:
